Junyoung Park

Seoul, Republic of Korea
pjy5451@gmail.com · pjy5451.github.io · Google Scholar · ORCID · LinkedIn

RESEARCH INTERESTS

- Inverse problems and parameter estimation in structural systems
- Probabilistic modeling of uncertainty in structural measurements and models
- Structural condition assessment from continuous field measurements
- Long-term field monitoring of in-service structures (bridges, pavements, ports, precast members)

EDUCATION

Chung-Ang University **2022 – 2024**
M.S. in Civil Engineering (Structural Engineering) · *Seoul, Republic of Korea*
- Thesis: A Scalable Bridge Health Monitoring System using an IoT Sensor and Cloud Computing
- Advisor: the late Prof. Jong-Woong Park · GPA 4.39 / 4.5

Chung-Ang University **2017 – 2022**
B.E. in Civil Engineering & B.S. in Mathematics (Double Degree) · *Seoul, Republic of Korea*
- Thesis: Development of a Low-power IoT Sensor and a Cloud-based Data Fusion Displacement Estimation Method for Ambient Bridge Monitoring
- GPA 4.20 / 4.5 (summa cum laude)
- Relevant coursework: Analysis I–II, Partial Differential Equations, Differential Equations I–II, Numerical Analysis, Probability and Statistics, Differential Geometry I–II

RESEARCH EXPERIENCE

Researcher | UDNS Co., Ltd., R&D Division **2024 – Present**
Industrial Technical Personnel Program (R&D-based alternative to military service) · *Republic of Korea*

Plate-type high-speed weigh-in-motion (HS-WIM) system development and field validation (MOLIT) 2024 – Present
- Designed the multi-channel signal acquisition PCB for the load cells
- Developed signal-processing algorithms that extract axle load, gross weight, speed, and vehicle dimensions from raw sensor signals, combining automatic load-segment detection with FIR-filtered dynamic weight estimation
- Conducted on-road field tests with loaded trucks to reduce estimation error across vehicle class, speed, and payload

HS-WIM signal analysis and accuracy improvement (MOLIT) 2024 – Present
- Developed deep-learning-based fault-tolerant reconstruction of multi-channel HS-WIM signals
- Analyzed paired HS-WIM and on-board mass signals toward auto-calibration without a reference scale
- Analyzed traffic patterns from a year of continuous HS-WIM measurements, characterizing vehicle class and gross weight by time of day and season

On-board mass (OBM) system for real-time heavy-vehicle load monitoring 2024 – Present
- Improved dynamic weight estimation accuracy by estimating payload from multi-channel suspension sensors and compensating vehicle dynamic effects with IMU signals
- Conducted environmental, EMC, and ingress-protection testing for TCA Category B type approval
- Defined the communication protocol between the network module and the mobile application, and modified the Android application accordingly

Graduate Researcher | Smart Infrastructure Technology Laboratory **2019 – 2024**
Chung-Ang University · *Seoul, Republic of Korea*

Long-term monitoring of in-service bridges (Seoul Metropolitan Government; M.S. thesis) 2020 – 2024
- Designed JANET, a low-power IoT sensor: 24-bit three-axis accelerometer, eight strain channels, 0.34 mA standby, direct LTE Cat-1 communication
- Instrumented Seongsan, Paldang, Seosomun, and Jamsu bridges and collected over one year of continuous data under live traffic at 1 kHz across eight channels (3-axis acceleration, four strain, temperature)
- Built and operated a scalable data pipeline and dashboards serving all four bridges from a single cloud back end
- Tracked natural frequencies over a year, where seasonal temperature variation dominated the observed shifts
- Validated sensor-fusion displacement estimation against a laser vibrometer reference, achieving under 1% error

Bridge load testing and load-carrying capacity evaluation (MOLIT) 2020 – 2024
- Developed a portable multimetric sensing system (JANET) and web-based document automation for capacity evaluation
- Devised an automatic load-event interval recognition method for continuous load-carrying capacity assessment

Monitoring of precast members during transportation and construction (MOLIT) 2020 – 2024
- Developed a portable gateway-and-JANET system for real-time safety monitoring of prefabricated members in transit
- Monitored acceleration, tilt, strain, and temperature throughout lifting, loading, and transport, with chatbot anomaly alerts

Strain visualization module with E-paper QR display (MOLIT) 2021 – 2024
- Developed an ultra-low-power multi-channel module that records strain history from fabrication to service and holds it on an embedded E-paper display that remains readable with no power

– Built a chatbot-based QR acquisition pipeline and automated reporting

Smart port berthing monitoring (MOLIT) 2021 – 2023
– Developed a wireless sensing system for long-term monitoring of caisson-type quay walls, integrating a high-sensitivity accelerometer with tilt, temperature, camera, and rangefinder modules
– Triggered vibration measurement on vessel berthing and unberthing, with an AI classifier to identify quay-wall events

Self-stress sensing circuit for ultra-high-performance concrete (NRF) 2020 – 2021
– Designed a low-cost multi-channel wireless sensing circuit that infers the loading state of self-sensing concrete from resistance change

Low-cost IoT seismic sensor (NRF) 2019
– Designed an ultra-low-power seismic sensor built for under $50 per unit
– Developed a two-phase detection algorithm: STA/LTA screening in the time domain, then classification by spectral content

Visiting Researcher | University of Hawaii at Manoa 2022
Department of Civil, Environmental and Construction Engineering · Honolulu, HI, USA · two-week research visit
– Implemented GPS-based time synchronization on JANET for multi-point road-surface vibration measurement
– Configured and demonstrated the measurement setup for the host lab, and gave a lab seminar on the sensing platform

AWARDS

- **Best Paper Presentation Award**, Korea Institute for Structural Maintenance and Inspection **2024**
- **Gold Award**, X-Corps Plus Festival, NRF **2022**
- **Innovation Award**, Smart Construction Challenge (IoT / AI / Sensing), MOLIT · Korea National Railway **2021**
- **Minister of the Interior and Safety Award** — Smart Earthquake Detection Competition **2019**

Scholarships: CAU Graduate Research Scholarship (full graduate tuition, 2022–2023); SeAH Haiam Scholarship (full undergraduate tuition, 2020–2021); CAU Academic Excellence Scholarships (Fall 2017, Spring 2018).

MENTORING

- Mentored two undergraduate research projects, Undergraduate Research Program (URP), Chung-Ang University
- *Long-term monitoring of quay walls with wireless sensors* (Junsik Shin, 2023) — high-sensitivity accelerometers with AI-based vessel detection; later developed into a peer-reviewed paper
- *Vision-based long-term 6-DOF monitoring of bridge bearings* (Gunhee Kim, 2022)

SKILLS & LANGUAGES

Programming: Python, MATLAB, C, JavaScript / Node.js
Machine learning: PyTorch, scikit-learn, pandas, NumPy, YOLO
Hardware & design: Altium Designer, SolidWorks, Simulink, LabVIEW
Software & data: Android and web development, AWS, Docker, MySQL, InfluxDB, Grafana
Languages: English (TOEFL iBT 100/120, C1, 2026), Korean (native)
